Stability Enhancement Of Multi Machine

Transient stability enhancement of multi-machine power systems using a distributed power controller has been discussed in [7]. Power system stability enhancement by damping and control of SSR (Subsynchronous resonance) using large scale PV-plant has been discussed in [8], [9]. In [10], a large scale PV system is controlled for the alleviation of power system oscillations.

The PSS (Fig.1) adds damping to the generator unit's characteristic electromechanical oscillations by modulating the generator excitation to develop components of electrical torque in phase with rotor speed deviations. The PSS thus contributes to the enhancement of small-signal stability of power systems.

Abstract. This paper presents the design of a sliding-mode perturbation observer-based sliding-mode control for stability enhancement of multi-machine power systems. The combinatorial effect of nonlinearities, parameter uncertainties, unmodelled dynamics and time-varying external disturbances is aggregated into a perturbation, which is rapidly estimated by a sliding-mode state and perturbation observer and then fully compensated by a sliding-mode controller in real time.
